Abstract

The Concise Guide to PHARMACOLOGY 2017/18 provides concise overviews of the key properties of nearly 1800 human drug targets with an emphasis on selective pharmacology (where available), plus links to an open access knowledgebase of drug targets and their ligands (www.guidetopharmacology.org), which provides more detailed views of target and ligand properties. Although the Concise Guide represents approximately 400 pages, the material presented is substantially reduced compared to information and links presented on the website. It provides a permanent, citable, point-in-time record that will survive database updates. The full contents of this section can be found at <http://onlinebibrary.wiley.com/doi/10.1111/bph.13880/full>. Nuclear hormone receptors are one of the eight major pharmacological targets into which the Guide is divided, with the others being: G protein-coupled receptors, ligand-gated ion channels, voltage-gated ion channels, other ion channels, catalytic receptors, enzymes and transporters. These are presented with nomenclature guidance and summary information on the best available pharmacological tools, alongside key references and suggestions for further reading. The landscape format of the Concise Guide is designed to facilitate comparison of related targets from material contemporary to mid-2017, and supersedes data presented in the 2015/16 and 2013/14 Concise Guides and previous Guides to Receptors and Channels. It is produced in close conjunction with the Nomenclature Committee of the Union of Basic and Clinical Pharmacology (NC-IUPHAR), therefore, providing official IUPHAR classification and nomenclature for human drug targets, where appropriate.

Conflict of interest

The authors state that there are no conflicts of interest to declare.

Overview: Nuclear receptors are specialised transcription factors with commonalities of sequence and structure, which bind as homo- or heterodimers to specific consensus sequences of DNA (response elements) in the promoter region of particular target genes. They regulate (either promoting or repressing) transcription of these target genes in response to a variety of endogenous ligands. Endogenous agonists are hydrophobic entities which, when bound to the receptor, promote conformational changes in the receptor to allow recruitment (or dissociation) of protein partners, generating a large multiprotein complex.

Two major subclasses of nuclear receptors with identified endogenous agonists can be identified: steroid and non-steroid hormone receptors. Steroid hormone receptors function typically as dimeric entities and are thought to be resident outside the nucleus in the unliganded state in a complex with chaperone proteins, which are liberated upon agonist binding. Migration to the nucleus and interaction with other regulators of gene transcription, including RNA polymerase, acetyltransferases and deacetylases, allows gene transcription to be regulated. Non-steroid hormone receptors typically exhibit a greater distribution

in the nucleus in the unliganded state and interact with other nuclear receptors to form heterodimers, as well as with other regulators of gene transcription, leading to changes in gene transcription upon agonist binding. Selectivity of gene regulation is brought about through interaction of nuclear receptors with particular consensus sequences of DNA, which are arranged typically as repeats or inverted palindromes to allow accumulation of multiple transcription factors in the promoter regions of genes.

Family structure

1A. Thyroid hormone receptors

Nuclear hormone receptors → 1A. Thyroid hormone receptors

Overview: Thyroid hormone receptors (TRs, **nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors** [41]) are nuclear hormone receptors of the NR1A family, with diverse roles regulating macronutrient metabolism, cognition and cardiovascular homeostasis. TRs are activated by thyroxine (T₄) and thyroid hormone (triiodothyronine). Once activated by a ligand, the receptor acts as a transcription factor either as a monomer, homodimer or heterodimer with members of the retinoid X receptor family. **NH-3** has been described as an antagonist at TRs with modest selectivity for TRβ [110].

Nomenclature	Thyroid hormone receptor-α	Thyroid hormone receptor-β
Systematic nomenclature	NR1A1	NR1A2
HGNC, UniProt	THRA, P10827	THRB, P10828
Rank order of potency	triiodothyronine > T ₄ dextrothyroxine [19]	triiodothyronine > T ₄ dextrothyroxine [19] sobetirome [26, 130]
Agonists		
Selective agonists	–	

Comments: An interaction with integrin αVβ3 has been suggested to underlie plasma membrane localization of TRs and non-genomic signalling [8]. One splice variant, TRα₂, lacks a functional DNA-binding domain and appears to act as a transcription suppressor. Although radioligand binding assays have been described for these receptors, the radioligands are not commercially available.

1B. Retinoic acid receptors

Nuclear hormone receptors → 1B. Retinoic acid receptors

Overview: Retinoic acid receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [46]**) are nuclear hormone receptors of the NR1B family activated by the vitamin A-derived agonists tretinoin (ATRA) and alitretinoin, and the RAR-selective synthetic agonists TTNPB and adapalene. BMS493 is a family-selective antagonist [47].

Nomenclature	Retinoic acid receptor-α	Retinoic acid receptor-β	Retinoic acid receptor-γ
Systematic nomenclature	NR1B1	NR1B2	NR1B3
HGNC, UniProt	RARA, P10276	RARB, P10826	RARG, P13631
Agonists	tretinoin [25]	tretinoin [25]	tretinoin [25]
Sub/family-selective agonists	tazarotene [25]	tazarotene [25], adapalene [24]	tazarotene [25], adapalene [24]
Selective agonists	BMS753 [53], tamibarotene [146], Ro 40-6055 [33]	AC261066 [89], ACS5649 [88, 89]	AHPN [24]
Selective antagonists	Ro 41-5253 (pIC ₅₀ 6.3–7.2) [2, 69]	–	MM 11253 [76]

Comments: Ro 41-5253 has been suggested to be a PPARγ agonist [129]. LE135 is an antagonist with selectivity for RARα and RARβ compared with RARγ [84].

1C. Peroxisome proliferator-activated receptors

Nuclear hormone receptors → 1C. Peroxisome proliferator-activated receptors

Overview: Peroxisome proliferator-activated receptors (PPARs, **nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [101]**) are nuclear hormone receptors of the NR1C family, with diverse roles regulating lipid homeostasis, cellular differentiation, proliferation and the immune response. PPARs have many potential endogenous agonists [13, 101], including 15-deoxy-Δ^{12,14}-PGJ₂, prostacyclin (PGI₂), many fatty acids and their oxidation products, lysophosphatidic acid (LPA) [98, 13-HODE, 15S-HETE, Paz-PC, azelaoyl-PAF and leukotriene B₄ (LTB₄). Bezafibrate acts as a non-selective agonist for the PPAR family [155]. These receptors also bind hypolipidaemic drugs (PPARα) and anti-diabetic thiazolidinediones (PPARγ), as well as many non-steroidal anti-inflammatory drugs, such as sulindac and indomethacin. Once activated by a ligand, the receptor forms a heterodimer with members of the retinoid X receptor family and can act as a transcription factor. Although radioligand binding assays have been described for all three receptors, the radioligands are not commercially available. Commonly, receptor occupancy studies are conducted using fluorescent ligands and truncated forms of the receptor limited to the ligand binding domain.

Nomenclature	Peroxisome proliferator-activated receptor- α	Peroxisome proliferator-activated receptor- β/δ	Peroxisome proliferator-activated receptor- γ
Systematic nomenclature	NR1C1	NR1C2	NR1C3
HGNC, UniProt	PPARA, Q07869	PPARD, Q03181	PPARG, P37231
Selective agonists	GW7647 [17, 18], CP-775146 [67], pinixic acid [155], gemfibrozil [31]	GW0742X [50, 148], GW501516 [112]	GW1929 [17], bardoxolone (Partial agonist) [149], rosiglitazone [59, 80, 86, 161], troglitazone [59, 161], pioglitazone [7, 59, 127, 161], ciglitazone [59]
Selective antagonists	GW6471 (pIC ₅₀ 6.6) [158]	GSK0660 (pIC ₅₀ 6.5) [131]	T0070907 (pK _i 9) [77], GW9662 (Irreversible inhibition) (pIC ₅₀ 8.1) [78], CDDO-Me (pK _i 6.9) [149]

Comments: As with the estrogen receptor antagonists, many agents show tissue-selective efficacy (e.g. [12, 109, 124]). Agonists with mixed activity at PPAR α and PPAR γ have also been described (e.g. [35, 52, 159]).

1D. Rev-Erb receptors

Nuclear hormone receptors → 1D. Rev-Erb receptors

Overview: Rev-erb receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]**) have yet to be officially paired with an endogenous ligand, but are thought to be activated by heme.

Nomenclature	Rev-Erb- α	Rev-Erb- β
Systematic nomenclature	NR1D1	NR1D2
HGNC, UniProt	NR1D1, P20393	NR1D2, Q14995
Endogenous agonists	heme [121, 160]	heme [97, 121, 160]
Selective agonists	GSK4112 [51], GSK4112 [70]	–
Selective antagonists	SR8278 (pIC ₅₀ 6.5) [70]	–

Further reading on 1D. Rev-Erb receptors

1F. Retinoic acid-related orphans

Nuclear hormone receptors → 1F. Retinoic acid-related orphans

Overview: Retinoic acid receptor-related orphan receptors (ROR, **nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]**) have yet to be assigned a definitive endogenous ligand, although RORα may be synthesized with a 'captured' agonist such as cholesterol [65, 66].

Nomenclature	RAR-related orphan receptor-α	RAR-related orphan receptor-β	RAR-related orphan receptor-γ
Systematic nomenclature	NR1F1	NR1F2	NR1F3
HGNC, UniProt	RORA, P35398	RORβ, Q92753	RORC, P51449
Endogenous agonists	cholesterol [66, 114]	–	–
Selective agonists	7-hydroxycholesterol [14], cholesterol sulphate [14, 66]	–	–

Comments: tretinoin shows selectivity for RORβ within the ROR family [136]. RORα has been suggested to be a nuclear receptor responding to melatonin [154].

Further reading on 1F. Retinoic acid-related orphans

1H. Liver X receptor-like receptors

Nuclear hormone receptors → 1H. Liver X receptor-like receptors

Overview: Liver X and farnesoid X receptors (LXR and FXR, **nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [105]**) are members of a steroid analogue-activated nuclear receptor subfamily, which form heterodimers with members of the retinoid X receptor family. Endogenous ligands for LXRs include hydroxycholesterols (OHC), while FXRs appear to be activated by bile acids.

Nomenclature Systematic nomenclature	Farnesoid X receptor	Farnesoid X receptor-β	Liver X receptor-α	Liver X receptor-β
	NR1H4	NR1H5	NR1H3	NR1H2
HGNC, UniProt	NR1H4, Q96R11	NR1H5P, –	NR1H3, Q13133	NR1H2, P55055
Potency order	chenodeoxycholic acid > lithocholic acid, deoxycholic acid [92, 115]	–	20S-hydroxycholesterol, 22R-hydroxycholesterol, 24(S)-hydroxycholesterol > 25-hydroxycholesterol, 27-hydroxycholesterol [79]	20S-hydroxycholesterol, 22R-hydroxycholesterol, 24(S)-hydroxycholesterol > 25-hydroxycholesterol, 27-hydroxycholesterol [79]
Endogenous agonists	–	lanosterol [113] – Mouse	–	–
Selective agonists	GW4064 [94], obeticholic acid [116], fexaramine [36]	–	–	–
Selective antagonists	guggulsterone (p)C ₅₀ 5.7–6 [157]	–	–	–

Comments: T0901317 [122] and GW3965 [27] are synthetic agonists acting at both LXRα and LXRβ with less than 10-fold selectivity.

11. Vitamin D receptor-like receptors

Nuclear hormone receptors → 11. Vitamin D receptor-like receptors

Overview: Vitamin D (VDR), Pregnane X (PXR) and Constitutive Androstane (CAR) receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [105]**) are members of the NR11 family of nuclear receptors, which form heterodimers with members of the retinoid X receptor family. PXR and CAR are activated by a range of exogenous compounds, with no established endogenous physiological agonists, although high concentrations of bile acids and bile pigments activate PXR and CAR [105].

Nomenclature	Vitamin D receptor	Pregnane X receptor	Constitutive androstane receptor
Systematic nomenclature	NR111	NR112	NR113
HGNC, UniProt	VDR, P11473	NR112, O75469	NR113, Q14994
Endogenous agonists	1,25-dihydroxyvitamin D3 [11, 39]	17 β -estradiol [64]	–
Selective agonists	seocalcitol [28, 153], doxercalciferol	hyperforin [106, 152], 5 β -pregnane-3,20-dione [64], lovastatin [81], rifampicin [15, 81]	TCPOBOP [144] – Mouse, CITCO [91]
Selective antagonists	TEL-9647 (pIC ₅₀ 8.2) [126] – Chicken, ZK159222 (pIC ₅₀ 7.5) [42, 60]	–	–
Comments	–	–	clotrimazole [107] and T0901317 [68] although acting at other sites, function as antagonists of the constitutive androstane receptor.

Rev.* **58**: 742–59 [PMID:17132852]

2A. Hepatocyte nuclear factor-4 receptors

Nuclear hormone receptors → 2A. Hepatocyte nuclear factor-4 receptors

Overview: The nomenclature of hepatocyte nuclear factor-4 receptors is agreed by the **NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]**. While linoleic acid has been identified as the endogenous ligand for HNF4 α , its function remains ambiguous [163]. HNF4 γ has yet to be paired with an endogenous ligand.

Nomenclature	Hepatocyte nuclear factor-4- α		
Systematic nomenclature	NR2A1		
HGNC, UniProt	HNF4A, P41235		
Endogenous agonists	linoleic acid [163]		
Selective antagonists	BI6015 [71]		
Comments	HNF4 α has constitutive transactivation activity [163] and binds DNA as a homodimer [63].		
		Hepatocyte nuclear factor-4- γ	
		NR2A2	
		HNF4G, Q14541	
		–	
		–	
		–

2B. Retinoid X receptors

Nuclear hormone receptors → 2B. Retinoid X receptors

Overview: Retinoid X receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [45]**) are NR2B family members activated by [all-trans-retinoic acid](#) and the RXR-selective agonists [bexarotene](#) and [LG100268](#), sometimes referred to as [retinoids](#). [UV13003 \[108\]](#) and [HX 531 \[37\]](#) have been described as a pan-RXR antagonists. These receptors form RXR-RAR heterodimers and RXR-RXR homodimers [22, 96].

Nomenclature	Retinoid X receptor- α		Retinoid X receptor- β	Retinoid X receptor- γ
Systematic nomenclature	NR2B1		NR2B2	NR2B3
HGNC, UniProt	RXRA, P19793		RXR β , P28702	RXR γ , P48443
Sub/family-selective agonists	bexarotene [16, 21, 141]		bexarotene [16, 21, 141]	bexarotene [16, 21, 141]
Selective agonists	CD3254 [48]		–	–

2C. Testicular receptors

Nuclear hormone receptors → 2C. Testicular receptors

Overview: Testicular receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]**) have yet to be officially paired with an endogenous ligand, although testicular receptor 4 has been reported to respond to retinoids.

Nomenclature	Testicular receptor 2	Testicular receptor 4
Systematic nomenclature	NR2C1	NR2C2
HGNC, UniProt	NR2C1, P13056	NR2C2, P49116
Endogenous agonists	–	retinol [169], tretinoin [169]
Comments	Forms a heterodimer with TR4; gene disruption appears without effect on testicular development or function [132].	Forms a heterodimer with TR2.

2E. Tailless-like receptors

Nuclear hormone receptors → 2E. Tailless-like receptors

Overview: Tailless-like receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]**) have yet to be officially paired with an endogenous ligand.

Nomenclature	TLX	PNR
Systematic nomenclature	NR2E1	NR2E3
HGNC, UniProt	NR2E1, Q9Y466	NR2E3, Q9Y5X4
Comments	Gene disruption is associated with abnormal brain development [75, 104].	
		–

2F. COUP-TF-like receptors

Nuclear hormone receptors → 2F. COUP-TF-like receptors

Overview: COUP-TF-like receptors (nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]) have yet to be officially paired with an endogenous ligand.

Nomenclature	COUP-TF1	COUP-TF2	V-erbA-related gene
Systematic nomenclature	NR2F1	NR2F2	NR2F6
HGNC, UniProt	NR2F1, P10589	NR2F2, P24468	NR2F6, P10588
Comments	Gene disruption is perinatally lethal [120].	Gene disruption is embryonically lethal [117].	Gene disruption impairs CNS development [151].

3B. Estrogen-related receptors

Nuclear hormone receptors → 3B. Estrogen-related receptors

Overview: Estrogen-related receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]**) have yet to be officially paired with an endogenous ligand.

Nomenclature	Estrogen-related receptor-α	Estrogen-related receptor-β	Estrogen-related receptor-γ
Systematic nomenclature	NR3B1	NR3B2	NR3B3
HGNC, UniProt	ESRRα, P11474	ESRRβ, O95718	ESRRγ, P62508
Comments	Activated by some dietary flavonoids [138]; activated by the synthetic agonist GSK4716 [181] and blocked by XCT790 [156].	May be activated by DY131 [162].	May be activated by DY131 [162].

4A. Nerve growth factor IB-like receptors

Nuclear hormone receptors → 4A. Nerve growth factor IB-like receptors

Overview: Nerve growth factor IB-like receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]**) have yet to be officially paired with an endogenous ligand.

Nomenclature	Nerve Growth factor IB	Nuclear receptor related 1	Neuron-derived orphan receptor 1
Systematic nomenclature	NR4A1	NR4A2	NR4A3
HGNC, UniProt	NR4A1, P22736	NR4A2, P43354	NR4A3, Q92570
Comments	An endogenous agonist, cytosporone B, has been described [164], although structural analysis and molecular modelling has not identified a ligand binding site [4, 40, 150].	–	–

5A. Fushi tarazu F1-like receptors

Nuclear hormone receptors → 5A. Fushi tarazu F1-like receptors

Overview: Fushi tarazu F1-like receptors (nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors [6]) have yet to be officially paired with an endogenous ligand.

Nomenclature	Steroidogenic factor 1	Liver receptor homolog-1
Systematic nomenclature	NR5A1	NR5A2
HGNC, UniProt	NR5A1, Q13285	NR5A2, O00482
Comments	Reported to be inhibited by AC45594 [32] and SID7969543 [90].	–

Steroid hormone receptors

Nuclear hormone receptors → Steroid hormone receptors

Overview: Steroid hormone receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Nuclear Hormone Receptors** [30, 87]) are nuclear hormone receptors of the NR3 class, with endogenous agonists that may be divided into 3-hydroxysteroids (estrone and 17 β -estradiol) and 3-ketosteroids (dihydrotestosterone [DHT], aldosterone, cortisol, corticosterone, progesterone and testosterone). These receptors exist as dimers coupled with chaperone molecules (such as hsp90B (*HSP90AB1*, P08238) and immunophilin FKBP52:*FKBP4*, Q02790), which are shed on binding the steroid hormone. Although rapid signalling phenomena are observed [83, 119], the principal signalling cascade appears to involve binding of the activated receptors to nuclear hormone response elements of the genome, with a 15-nucleotide consensus sequence AGA-C α nnTGTTC (i.e. an inverted palindrome) as homo- or heterodimers. They also affect transcription by protein-protein interactions with other transcription factors, such as activator protein 1 (AP-1) and nuclear factor κ B (NF- κ B). Splice variants of each of these receptors can form functional or non-functional monomers that can dimerize to form functional or non-functional receptors. For example, alternative splicing of PR mRNA produces A and B monomers that combine to produce functional AA, AB and BB receptors with distinct characteristics [145]. A 7TM receptor responsive to estrogen (*GPER1*, Q99527, also known as GPR30, see [118]) has been described. Human orthologues of 7TM 'membrane progesterin receptors' (*PAQR7*, *PAQR8* and *PAQR5*), initially discovered in fish [170, 171], appear to localize to intracellular membranes and respond to 'non-genomic' progesterone analogues independently of G proteins [134].

3A. Estrogen receptors

Nuclear hormone receptors → Steroid hormone receptors → 3A. Estrogen receptors

Overview: Estrogen receptor (ER) activity regulates diverse physiological processes via transcriptional modulation of target genes. The selection of target genes and the magnitude of the response, be it induction or repression, are determined by many factors, including the effect of the hormone ligand and DNA binding on ER structural conformation, and the local cellular regulatory environment. The cellular environment defines the specific complement of DNA enhancer and promoter elements present and the availability of coregulators to form functional transcription complexes. Together, these determinants control the resulting biological response.

Nomenclature	Estrogen receptor- α	Estrogen receptor- β
Systematic nomenclature	NR3A1	NR3A2
HGNC, UniProt	<i>ESR1</i> , P03372	<i>ESR2</i> , Q92731
Endogenous agonists	estrinol [74], estrone [74]	-

(continued)	
Nomenclature	Estrogen receptor- α
Selective agonists	propylpyrazotetrol [73, 135], ethinylestradiol [62]
Sub/family-selective antagonists	bazedoxifene (p <i>K</i> ₅₀ 7.6) [103]
Selective antagonists	clomiphene (p <i>K</i> _i 8.9) [3], methyl-piperidino-pyrazole (p <i>K</i> _i 8.6) [139]
	Estrogen receptor- β
	WAY200070 [93], diarylpropionitrile [100, 135], prinabereil [29, 93]
	bazedoxifene (p <i>K</i> ₅₀ 7.1) [103]
	R,R-THC (p <i>K</i> _i 8.4) [99, 140], PHTPP (p <i>K</i> _i 6.9) [168]

Comments: R,R-THC exhibits partial agonist activity at ER α [99, 140]. Estrogen receptors may be blocked non-selectively by tamoxifen and raloxifene and labelled by [³H]17 β -estradiol and [³H]tamoxifen. Many agents thought initially to be antagonists at estrogen receptors appear to have tissue-specific efficacy (e.g. Tamoxifen is an antagonist at estrogen receptors in the breast, but is an agonist at estrogen receptors in the uterus), hence the descriptor SERM (selective estrogen receptor modulator) or SnERM (selective nuclear receptor modulator). Y134 has been suggested to be an ER α -selective estrogen receptor modulator [111].

3C. 3-Ketosteroid receptors

Nuclear hormone receptors → Steroid hormone receptors → 3C. 3-Ketosteroid receptors

Nomenclature	Androgen receptor	
Systematic nomenclature	NR3C4	
HGNC, UniProt	AR, P10275	
Rank order of potency	dihydrotestosterone [142] > testosterone	
Selective agonists	testosterone propionate [95], mibolerone [49], fluoxymesterone [61], methyltrienolone [148], dromostanolone propionate	
Selective antagonists	bicalutamide (p <i>K</i> _i 7.7) [70], PF0998425 (p <i>K</i> ₅₀ 7.1–7.5) [85], enzalutamide (p <i>K</i> ₅₀ 7.4) [143], nilutamide (p <i>K</i> ₅₀ 7.1–7.1) [133], hydroxyflutamide (p <i>K</i> ₅₀ 6.6) [148], galeterone (p <i>K</i> ₅₀ 6.4) [56], flutamide (p <i>K</i> _i 5.4) [147]	
Labelled ligands	[³ H]dihydrotestosterone (Selective Agonist), [³ H]methyltrienolone (Selective Agonist), [³ H]mibolerone (Agonist)	
		Glucocorticoid receptor
		NR3C1
		NR3C1, P04150
		cortisol, corticosterone ≫ aldosterone, deoxycortisone [125]
		fluticasone propionate [10], beclometasone [3], methylprednisolone [3], fluciclonide [3], betamethasone [3], budesonide [102]
		onapristone (p <i>K</i> ₅₀ 7.6) [165], ZK112993
		[³ H]dexamethasone (Agonist)

Nomenclature	Mineralocorticoid receptor	
Systematic nomenclature	NR3C2	
HGNC, UniProt	NR3C2, P08235	
Rank order of potency	corticosterone, cortisol, aldosterone [58, 125], progesterone [125]	
Selective agonists	–	
Selective antagonists	finerenone (pIC ₅₀ 7.7) [20], eplerenone (pK _i 6.9) [5], onapristone (pIC ₅₀ 6.3) [165], RU28318, ZK112993	
Labelled ligands	[³ H]aldosterone (Selective Agonist) [44, 137] – Rat	
	Progesterone receptor	
	NR3C3	
	PC R, P06401	
	progesterone [38]	
	medroxyprogesterone (Affinity at human PR-A) [166], ORG2058, levonorgestrel [9, 128]	
	ulipristal acetate (pIC ₅₀ 9.7) [123], mifepristone (Mixed) (pK _i 9) [167], onapristone (pK _i 7.7) [54], ZK112993	
	[³ H]ORG2058 (Selective Agonist)	

Comments: [³H]dexamethasone also binds to MR *in vitro*. PR antagonists have been suggested to subdivide into Type I (e.g. onapristone) and Type II (e.g. ZK112993) groups. These groups appear to promote binding of PR to DNA with different efficacies and evoke distinct conformational changes in the receptor, leading to a transcription-neutral complex [43, 82]. Mutations in AR underlie testicular feminization and androgen insensitivity syndromes, spinal and bulbar muscular atrophy (Kennedy's disease).
